Assignment 1: Sorting Algorithms Performance Analysis

By Yazeed AlKhalaf | Student ID: 202211123 | SWE 429

Introduction

This assignment analyzes the performance characteristics of three fundamental sorting algorithms through empirical testing. The implementation and analysis provide insights into how these algorithms behave with different input sizes and configurations.

I implemented a test harness in Java to evaluate the algorithms with various input sizes. The test arrays were randomly generated, but in a deterministic manner by seeding the Random class with 1337. This seed can be modified to test different data distributions, but using a fixed seed ensures that the test arrays are reproducible across different environments.

Algorithms Analyzed

1. Insertion Sort

- A simple comparison-based algorithm that builds the sorted list one item at a time
- Generally efficient for small data sets or nearly sorted arrays
- Time complexity: $O(n^2)$ in worst case

Insertion Sort Performance 4,800,000 4,600,000 4,400,000 4.200.000 4,000,000 3,800,000 3,600,000 3,400,000 3,200,000 3,000,000 2,800,000 2,600,000 2,400,000 2,200,000 2,000,000 1,800,000 1,600,000 1,400,000 1,200,000 1,000,000 800,000 600,000 400,000 200,000 -200.000 1,000 2,500 3,000 3.500 4,000 4,500 5.000 Input Size Performance Data Best Fit Performance Data -

2. Merge Sort

- A divide-and-conquer algorithm that recursively divides the input array and merges sorted subarrays
- Provides consistent performance regardless of input organization
- Time complexity: O(n log n)

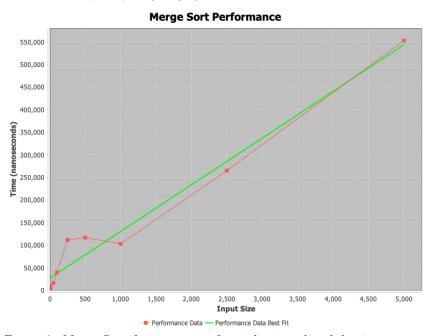

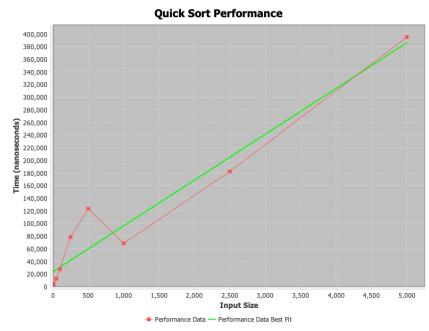

Figure 2: Merge Sort demonstrating logarithmic scaling behavior

3. Quick Sort

- Another divide-and-conquer algorithm using a pivot element
- Typically very efficient in practice despite worst-case scenarios
- Time complexity: O(n log n) average case, O(n²) worst case

Comparative Analysis

Combined Sorting Algorithms Performance

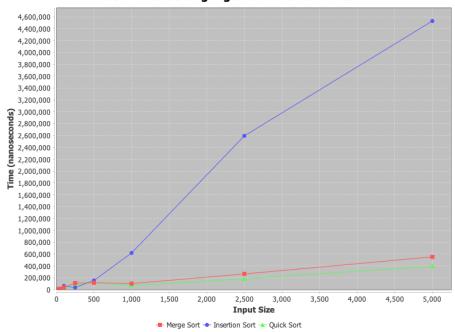

Figure 4: Comparative performance of all three sorting algorithms

Conclusion

The experimental results confirm theoretical expectations, with Insertion Sort showing quadratic growth for larger inputs while Merge Sort and Quick Sort demonstrate more efficient scaling. The specific characteristics of each algorithm make them suitable for different scenarios depending on input size and initial ordering.
